Continuation Sheet (PTO-303)

Application No.

Continuation of 11: Forslow et al. teaches a Public mobile data communications network, wherein an IP data packet is sent between a home agent and a foreign agent using a label switch path, (Col. 4, line 8); and When a label packet arrives at an LSR, the forwarding component uses the input port number and label to perform an exact match in its forwarding table. When a match is found, the forwarding component retrieves the outgoing label, the outgoing interface, and the next-hop router address from the forwarding table, wherein when there is a match (Col. 4, line 47).

Forslow et al. further discloses that the label switch (referred also as a label switched router (LSR)) performs a routing table lookup, maps the packet to an FEC, and then assigns a label to the packet before forwarding it to the next LSR in the label switched path (LSP), Ultimately, LSR ignore the data packet's network layer header and simply forward the data packet using the label swapping algorithm, wherein the label switch path is preconfigured to for the IP packet to be tunneled between foreign agent and home agent wherein this path doesn't change which means it is statically administered.

Also, Hiller et al. teaches a Method and system for support of overlapping IP addresses between an interworking function and a mobile IP foreign agent, while Forslow teaches A public mobile access data network provides a mobile node data access to the Internet and data access to the mobile node from the Internet even when a point of attachment of the mobile node to the public mobile access data network changes, the combination of Forslow and Hiller teaches a match between the destination address and the foreign agent, and that there is a label switch path between a foreign agent and a home agent, and that preconfigured label switch is not modified or created and it is statically administered.
